

Black Hole Gravitohydrodynamics (Astronomy and Astrophysics Library)

A new branch of physics, black hole gravitohydrodynamics (GHM) is developed from the rudiments to the frontiers of research. GHM describes plasma interactions that combine the effects of gravity and a strong magnetic field, in the vicinity (ergosphere) of a rapidly rotating black hole. This topic was created in response to the astrophysical quest to understand the central engines of radio loud extragalactic radio sources. The theory describes a torsional tug of war between rotating ergospheric plasma and the distant asymptotic plasma that extracts the rotational inertia of the black hole.
