

General discussion of the cotton production of the United States; embracing the cottonseed-oil industry, methods and utility of soil investigation, and tables of cotton fiber measurements

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1884 Excerpt: ...of their fields. Either the seed as a whole or the corresponding seed-cake must in common sense go back to the soil. a See the circular on page 43 and the table of soil ingredients withdrawn by various-crops, page 50. The following table, based ipon data obtained from the investigation of the question in the state of Mississippi, has often been used by the writer to make plain to audiences of farmers the peculiar advantages enjoyed by the cotton-grower as regards the maintenance of the productiveness of his soil. Potash and phosphoric acid, being the most valuable of the mineral ingredients contained, are segregated from the rest of the ash ingredients. The figures refer to the product of an acre of good upland soil as commonly obtained in Mississippi: Soil ingredients withdrawn by various crops. One lesson conveyed by this table, viz, that the removal of one crop of cottonseed depletes the soil to the same extent as that of ten crops of cotton lint, has already been referred to in the introductory circular. The comparison with other crops shows that none approaches cotton in respect to the slight exhaustion caused by the sale of the chief merchantable product, the lint, the relation being somewhat as if, in the case of corn, the shucks were only removed while returning the stalks and ears integrally; a proceeding under which most soils would improve instead of deteriorating, indefinitely. That this is not only theoretically but practically true, and that the conscientious return to the soil of each field of the cottonseed produced on it from the beginning of cultivation will, in the case of all soils of fair natural strength, maintain their cotton production uodiminished almost indefinitely, has been

repeatedly shown by actual experience in th...
