

Through The Looking Glass: The Science Behind The Flaw in the Law of Attraction

One of the key things you need to understand about how our universe works is that just about everything is possible and that just about nothing is impossible. That said, some things are far more likely to happen than other things. Thus, if you want something--anything--that you don't already have, then all you need to do is take whatever action is necessary to increase your odds of getting what you want. It's that simple. This book explores the science behind The Law of Realization: What The Secret Doesn't Tell You to more fully explain why the Law of Attraction cannot work for any practical purpose. Along the way, you will learn some amazing facts about the marvelous universe we live in. Imagine a science fiction novel in which: - Reality is granular. There are such things as a shortest possible time and a smallest possible mass, and where energy increases or decreases in jumps instead of along a smooth curve. - The inhabitants cannot ever know all there is to know. The more they know about some things, the less they can know about others. - Matter and energy are interchangeable and routinely transmute into each other. - Matter can jump from any location to any other location in an instant. - The sum total of energy (and therefore matter) is zero. - Solid matter can behave as either a solid or as a wave of energy. - It may be impossible to create or destroy information. Take a deep breath... and step Through The Looking Glass!
