

Mechanics of the household; A supplementary course of physics dealing with household appliances

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1911 Excerpt: ...working parts. The air chamber G, is shown partly filled with water; the impetus valve D, is that part of the Ram which checks the flow of the running water and forces a part of it through the valve E, at the bottom of the air chamber. When inactive the valve D, stands open and as the water enters from the pipe A, it flows through the valve to the waste pipe but as soon as the full force of the water bears on the valve it will suddenly close. This sudden stop of the Rowing water will lift the valve E, and the energy of flow, due to its sudden stopping, will force some of the water into the chamber G. As this action occurs the upward pressure against the valve D, is released and it reopens but immediately closes again as the water begins to flow. This process is kept up; each closure of the valve sending a little water into the air chamber. As the water gradually fills the air chamber, it is subjected to the same action as was described in the pressure tank; the air above the surface being compressed and the pressure developed in the space G, forces the water out through the delivery pipe where it attains a force that is a factor of the height of the original fall. The air in the air chamber is subject to the same conditions of loss as that of the pressure tank, and to be assured of a supply of air to give pressure to the water, some air must be carried into the chamber with the water. For this purpose the valve F, is provided. After the air chamber is patially filled, there occurs a reaction in the flow of water at each closure of the valve, which causes a little air to be drawn in through the valve F, with each impulse. This air bubbles up through the water and enters the air chamber where it assures an elastic

cushion for closing the valve E. The flow of ...
