

# Unconventional Electron Microscopy for Molecular Structure Determination (Advances in structure research by diffraction methods) (German Edition)

Generally it is not sufficiently appreciated that electron microscopy is in fact a diffraction method. In essential aspects electron microscopes are more closely related to X-ray diffractometers than to light microscopes. In electron microscopes monochromatized radiation and coherent illumination (never used in light microscopy) correspond in X-ray diffractometers to the primary beam with a small divergence. Imaging in a general sense can take place in interference experiments between a primary beam and a scattered beam, or between different deflected scattered beams. This leads to the realization of an old dream in diffraction, namely to a general experimental solution of the phase problem. The most impressive analogy, however, concerns the potential of the electron microscope as a tool for structure determination (where the radiation wavelength is smaller than the atomic distances). It was therefore considered timely to treat this topic in this series. It was a fortunate coincidence that in 1976 a Workshop on Unconventional Electron Microscope Methods for the Investigation of Molecular Structures (sponsored by the European Molecular Biology Organisation, the Deutsche Forschungsgemeinschaft and the Max-Planck-Gesellschaft) took place, and that most speakers presenting introductory lectures agreed to publish their contributions in an expanded version in this volume. This volume is thus not a symposium report in the usual sense since it contains the majority of these introductory lectures only.
